

Debriefing Script

Thank you for participating in this experiment! This experiment aims to investigate how a change in electrodermal activity (EDA) influences a person's perceived feedback from electrotactile stimuli.

A secondary goal is to see if there is a noticeable rate of change between EDA levels and perceived feedback, hence the two different tests.

If you want to ask any questions, request that your data not be used or anything else, please contact me at 2623719k@student.gla.ac.uk or my supervisor at stephen.brewster@glasgow.ac.uk
